

## Coveright's RTF Synergy Program

Please contact the RTF Manufacturer for further detail

**Thank You** for choosing COVERIGHT as your melamine source for leading edge Design. This collection of patterns is intended to provide a new level of design coordination between surfacing mediums. Coveright is cooperating with Rigid Thermo Foil ( RTF ) manufacturers by matching their vinyl designs in melamine-impregnable paper for Thermally Fused Melamine ( TFM ) applications.”

"Many of these matches have utilized the same print cylinders for the best match possible. In some cases a very close pattern has been used. This has been identified on our Comparison Guides. For convenience of portability Coveright samples have been produced in a thin laminated form that very closely simulates the actual TFM product, however slight variations occur in final production form as substrates and surface finishes vary from one manufacturer to another. Please call for an actual TFM sample on board for color approval."

"As you compare vinyl to melamine you may detect color shifting as light conditions change. This effect, called metamerism, is a result of the different light reflecting qualities of the raw materials used in these two surface products. Care has been taken to color match these products using carefully controlled mixed light, daylight and cool white fluorescent, in an effort to minimize this effect.

For all your vinyl needs, please contact the manufacturer directly.
